

## TAPE CONTROL MANUAL SHUTTERS – IN REVEAL

As per the previous two Information Bulletins 006 and 007, OZ Roll™ has introduced several new components specifically for tape controlled manual shutters.

These components will need to be ordered for assembled shutters with a tape control (winder or strap) being installed in the reveal of the window.

**The Insert Roller 13.240.401**

**The IR Tube - 13.246.401**

**The IR Roller - 13.250.401 Roller.**

In November 1999 OZ Roll™ introduced the SE Roller, part number 13.275.415. This roller will fit to any brand of head box and should be securely riveted in position. The small retaining clamp on the backside of the roller is meant to hold the roller in position while the rivets are fixed, but should not be load bearing.

OZ Roll™ has specifically developed all of these products for the benefit of our valued customers. We feel confident that these products will satisfy your requirements. The Insert Roller has a patent pending and the other components have design registration applied.
