

Stainless Steel Staples.

OZ Roll™ is proud to introduce the highest of quality “Stainless Steel Staples” to all our assembled roller shutters. These staples are used to retain the slat insert and are fitted to each end of every alternate slat in the shutter. The staples are concealed within the guide opening, however they remain exposed to the elements.

Rusted staples will allow the insert to work loose and the corroded staple can create problems in itself. Conventional staples are plated with a thin layer of corrosion resistant material such as nickel, and are very suitable for internal use, or where corrosion protection requirements are minimal. With high-grade stainless steel, the quality goes through and through.

“Quality that is not only Skin Deep”

The stainless steel staples supplied by OZ Roll™ are custom made to our unique requirements. Specifically designed for roller shutters these staples will hold on tight while not completely penetrating the slat profile.

Made from high strength **R316** Stainless Steel that will not corrode and leave ugly stains on the roller shutter.

The staple will suit many standard staple guns and specifically the guns suited to the conventional AZ33 staples. Available for purchase in convenient boxes of 2,500 staples each. The OZ Roll™ part number is 10.798.000 and stock is now available.

All OZ Roll™ assembled shutters are now fitted with these Stainless Steel Staples as standard.
