

## The Elipso® Strap Control

OZ Roll™ is proud to introduce the all new Elipso® Strap Control, which will now replace the current version of the manual tape strap control.

The new Elipso® strap control offers an improved appearance, incorporating a modern curved design that better suits today's home improvement trends. High quality materials offer a smooth glossy casing with reliable consistencies.

The internal mechanism has also been addressed with a refined design offering a positive and permanent drive axle for the spool to rotate on. Harder plastic materials reduce the flexibility of the housing and therefore improve the operation of the rotating spool.

For the installer there are several benefits in the new one piece housing that offers a hinged opening rather than the old style two part housing. This means that the rotating spool is completely captured between the two sides of the housing. This allows for the control tape to be fitted without the chance of the spring falling out and releasing tension.

The spool has a very positive tape retaining pin that is not part of the spring material so is not affected by the spring tension. The disposable plastic spring keeper can easily be removed and reinserted without the chance of it falling out.

The Elipso® strap control will come with a detailed fitting instruction that can be easily followed by the less experienced installer.

The new Elipso® Strap Control is available for immediate distribution and will be included standard in our installation kits from the start of June. The Elipso® strap control is available in white only with the part number being 13.151.401.
