

## New Standard Box End Plate Leg

In line with the latest Box End Insert (Refer Information Bulletin 45) we are pleased to advise the change to our standard box end leg.

The new leg is basically identical to the previous part, however it is moulded by a higher quality process and has one significant benefit being a hole moulded into the leg on one side.

The hole was requested by numerous customers and installers to benefit them when routing the cable during installation of the OZRoll Drive System. This hole provides a passage for the cable into the guide fixing cavity which allows for easy access and avoids having to rout the cable through a wall cavity.

Having the hole in the leg offers another significant advantage; it acts as a pilot hole that allows the installer to position the drill bit correctly and holds it in place while drilling through the end plate.

**The all-new Standard Box End Plate Leg part will be a direct replacement to the previous leg and therefore the identification number shall remain the same being 11.610.700.**
