

INTRODUCING – e-solarPRO The Modular Solar Drive System

E-solarPRO is the perfect solar drive solution for roller shutters and awnings.

The battery, control, radio receiver and solar module are installed within a compact preassembled unit – no drilling through walls, dirt or visible wires and of course no requirement for the expensive services of an Electrician!

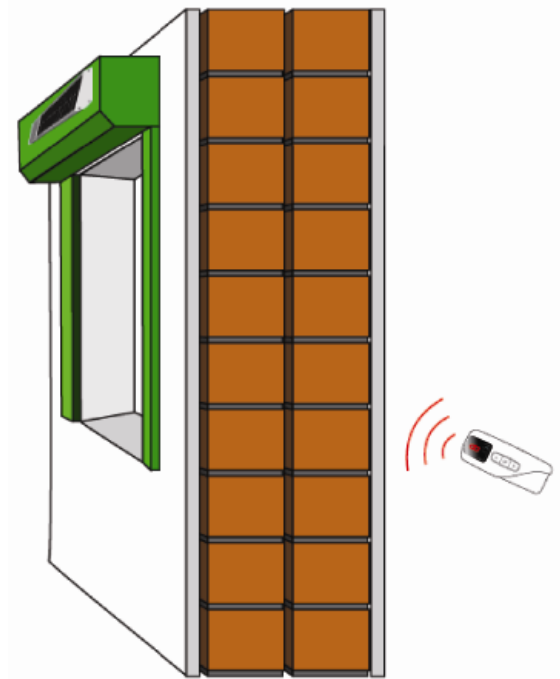

A powerful solar module charges the high performance LiFePO4 battery - even at low sunlight times. The battery can store enough power to provide the motor with energy for weeks, enabling motor operation during cloudy weather or at night.

Installation is quick and easy – assemble the motor, connect the two-pin cable to the E-solarPRO module, attach the module to the shutter headbox, wall or roof with the unique mounting clips and installation is complete! **It is recommended the E-solarPRO be installed in a position where it will receive a minimum of 1 hour of sunlight per day.**

The E-solarPRO is installed in conjunction with our full range of ODS Tubular Motors and the E-Trans 1CH or 9CH transmitter. **It is not suitable to be used with the ODS L10 Mech.**

The adaptable design allows the E-solarPRO to be used in a variety of ways depending on customer requirements or installation.

Please contact your Ozroll Account Executive for further information or to see the all new
E-SOLAR PRO Charging Panel.
