

E-Series In Wall AC Adaptor AUSTRALIA

A new In Wall AC Adaptor (or charger) has been developed to replace the Charger In Wall 240V (Black) – 15.248.001, which is no longer in production.

The new version is known as the:
E-Series In Wall AC Adaptor, AUST
Part Number - 15.580.108.

The In Wall version is a variation of the current charger system and has been slightly modified so it can be permanently wired to the wall plate. As the new version is based on the current E-Series AC Adaptor it is smaller, more modern in styling and much more energy efficient.

This product is designed to provide a permanent and hidden charging system for a single Wall Plate. They are particularly recommended for use with the E-Port 18650 RF Controls, which have extra demands on the battery.

The wiring of the in wall charger is designed to be routed through the wall cavity. This will allow the connection of a power outlet in the roof space to the back of a wall plate installed near the window. The power outlet in the roof must be within 3.8m of the wall plate position.

With the In Wall AC Adaptor the Controller is always on charge and will never go flat. Having a constant charging system is not an issue with the Ozroll Controllers, as the batteries in use do not develop “memory effect”.
