

New Non Restrained AE Slat Inserts (10.490.411)

A new Non-Restrained AE Slat Insert (10.490.411) has been developed and released for sale by Ozroll.

The inserts are not handed and are designed to be held in place by two screws (part number 19.900.019), which will need to be ordered separately.

The screws need to be fitted using a Torx 10 driver bit.

To avoid stripping of the screws a low torque setting is required on the tool being used to drive them in.

All curtain slats need to be cut accurately, at the same length, to avoid binding when the screws pull the insert up.

The slat cut allowance for these new inserts needs to be increased to 75mm.
